Beginning with some thoughts on how we define the concept of color Richard explains various methods people in history have used to systemize color These systems include the additive and subtractive color wheels which are addressed as metaphorical maps of color The basic vocabulary we use to describe color hue value and saturation are explained through illustrative and graphic means. In theoretical physics quantum chromodynamics QCD is the theory of the strong interaction between quarks and gluons the fundamental particles that make up positive hadrons such as the proton neutron and pion QCD is a type of quantum field theory called a non abelian gauge theory with symmetry group SU 3 The QCD analog of electric charge is a property called color.

Color theory is a vast and plicated sphere of knowledge. It consists of different scientific elements such as optics spectroscopy human anatomy and physiology psychology art history and theory philosophy ethics architecture theory design and many other applied sciences. Color is perceived in two ways through additive mixing where different colors are made by bining different colors of light and through subtractive mixing where different wavelengths of light are taken out so that the light is no longer pure white. For colors of coordination plexes subtractive mixing is considered.
