Although simple regression is a useful tool for extracting information about bivariate relationships that goes beyond what we get from a correlation or t test the real power of regression es from its ability to incorporate multiple independent variables this tutorial will build on the concepts discussed in our simple regression tutorial to

Multiple regression is one of the most mon statistical methods used in quantitative educational research despite the versatility and easy interpretability of multiple regression it has some shortings in the detection of suppressor variables and for somewhat arbitrarily assigning values to the structure coefficients of correlated independent variables. Graphic representation of multiple regression with two predictors the example above demonstrates how multiple regression is used to predict a criterion using two predictors to get a better feel for the graphic representation that underlies multiple regression the exercise below allows you to explore a 3 dimensional scatterplot. Multiple regression is used as a jumping off place for structural equation modeling with measured variables path analysis latent variables are introduced as a way of obviating some of the threats to path models and sem with latent variables is presented as the culmination of the previous topics. He ran a multiple linear regression which included four predictors hours spent taking part in physical activity per day calories consumed per day bmi and hours spent sitting per day his model had a r^2 of .665 an adjusted r^2 of .661 an f statistic of 112.56 $p < 0.001$. Use multiple regression when you have a more than two measurement variables one is the dependent variable and the rest are independent variables and should do a lot more reading about it beyond what is on this page you can and should look at the correlation between the dependent variable and each independent variable separately but. In the more general multiple regression model there are independent variables where is the t th observation on the t th independent variable if the first independent variable takes the value 1 for all then is called the regression intercept the least squares parameter estimates are obtained from normal equations the residual can be written as.
