Electrostatic motors similar in principle to the machine invented by benjamin franklin in 1748 motors of this type are based on the force of mutual attraction between unlike electric charges and the mutual repulsion of like charges the energy of the field can be tapped with a simple

Synchronous speed is the speed of rotation of the magnetic field in a rotary machine and it depends upon the frequency and number poles of the machine the induction motor always runs at speed less than its synchronous speed the rotating magnetic field produced in the stator will create flux in the rotor hence causing the rotor to rotate due to the lag between the flux current in the rotor.
