Abstract The objectives of this paper are 1 to

introduce the reader to the types of chemical reactions that are used to prepare polymers and 2 to acquaint him or her with the structural parameters that result in the usual physical properties displayed by these. Polymer chemistry is a vast research area and with so many papers published on the topic it is hard to know where to start and what papers to read. With contributions from leading experts across the world each book in the series covers key themes in polymer chemistry research for graduate students and researchers.

The 12 principles of green chemistry are reviewed and applied specifically to polymer production. Examples of how the principles relate to current practice in polymer reaction engineering and which areas show the greatest potential impact for implementation of these principles are discussed.
