Holography is a technique for recording information about an optical wavefront by interfering it with a reference coherent wave and was invented by dennis gabor

Holography on the other hand does not utilize a lens to form a latent image it relies on the principle of interference to produce an image the interference pattern is captured by the film and processed the hologram is then illuminated with laser light transmission or white light reflection a holographic image is then observed. We revisit the subject of holographic renormalization for asymptotically ads spacetimes for many applications of holography one has to handle the divergences associated with the on shell gravitational action the brute force approach uses the fefferman graham expansion near the ads boundary to identify the divergences but subsequent reversal of the expansion is needed to construct the.
