Principles of measurement traceability is all about providing a measurement scale for measurements to be meaningful and comparable they need to be measured on the same scale making a measurement of any kind involves comparing an unknown e.g. the test sample being measured with a standard as illustrated in figure 1

Traceability works as a pyramid at the top level there is the international standards at the next level national metrology institutes calibrate the primary standards through realisation of the units creating the traceability link from the primary standard and the unit definition. The core concept in metrology is traceability defined as the property of the result

of a measurement or the value of a standard whereby it can be related to stated references usually national or international standards through an unbroken chain of comparisons all having stated uncertainties.

The two main goals of metrology are the accuracy and traceability of chemical results metrology itself cannot ensure the truth of a chemical analysis but rather a consensus value based on the measurement of the same analyte s in a given sample by a large number of laboratories or by using a primary method
